This publication "Progotir Pathey 1997" depicts in figures, the current status of children of Bangladesh towards achieving the World Summit for Children Goals as enshrined in the National Plan of Action.

The report focusses on the state of children in areas of primary health care, nutrition, primary education, provision and use of safe water and sanitation and other related aspects of child survival, development and protection at district, divisional and national levels. The prevalence of children's disabilities has also been added in this report. We believe this report will enable research workers, policy planners and other concerned agencies to carry out in-depth household survey to identify the negative factors which impede effective implementation of intervention programmes.

The Multiple Indicator Cluster Survey (MICS) 1996/97 which was implemented during December 1996 and January 1997, followed a two stage stratified cluster sampling design with an average of between 650 to 800 households from 13-16 clusters at district level. The sample size comprises of nearly 52,000 households spread over the country. The data are

preface

representative at district, division and national level and are disaggregated by sex, urban, rural and urban low income areas.

The report also contains a number of graphs and data on national level IMR, U5-MR, TFR, CPR, literacy rate and other relevant aspects taken from 1991 Census and Sample Vital Registration System of BBS which supplement MICS data.

We thank Mr. Khurshid Kamal, Project Director, Goals Monitoring Project, Mrs. Riti Ibrahim, Deputy Director, BBS, Mr. Abdus Salam, Statistical Officer, BBS and Mr. Muhammad Shuaib of SURCH and UNICEF for their hard work towards the successful completion of this report.

Comments and suggestions for further improvement of the Publication will be welcome.

Waliul Islam
Director General

Bangladesh Bureau of Statistics, Statistics Division
Ministry of Planning, Government of the People's Republic of Bangladesh

Dhaka, September, 1997

In September 1990, world leaders agreed on an agenda for children and women for the 1990s. The World Summit Declaration, identified 7 major and 20 supporting goals to be achieved by the year 2000 for the survival, development, protection and participation of the worlds children. The Summit also called for all countries to prepare a National Plan of Action for the implementation of programmes to achieve the identified goals.

Bangladesh being a signatory to the World Summit Declaration, the Colombo and the Rawalpindi Resolution is committed globally and regionally to achieving the Goals for children, "Progotir Pathay" (the path to progress) documents the progress made towards the achievement of these cherished goals.

Article 35 of the World Summit Declaration states that all relevant UN agencies, with special emphasis on UNICEF as the world's lead agency for children, would assist and advocate national governments in establishing an appropriate mechanism for timely collection, analysis and publication of data to monitor the progress made towards the fulfillment of the Summit and the Mid-decade goals.

In the recent past, the major source of information on women and children was available from the various surveys conducted by the Bangladesh Bureau of Statistics (BBS). These surveys generated data which reflected the situation of women and children on some of the indicators at the national and divisional levels only. Information at the district level was virtually absent. In order to achieve the goals on Child Survival Protection and Development it was essential that information regarding the condition of women and children be available at a sub-national level (i.e. district level) also, so that the sub-national plans could be developed and monitored at regular intervals of time.

A collaborative effort between UNICEF, UN Statistics Divisions and Institute of Statistical Research and Training, Dhaka University resulted in the development of a statistically sound survey design, which, in a short interval of time, could generate data from District level cost effectively. This rapid survey methodology called the Multiple Indicator Cluster Survey (MICS) has been implemented in all the 64 Districts of Bangladesh from 1993. BBS will coordinate the survey on an annual basis and thus supplement the national information that is being generated through its regular surveys.

Bangladesh, situated in the north-eastern part of South Asia, is bounded by India, Myanmar and the Bay of Bengal. Except for the hilly regions in the east and high lands in the north, the country is largely a low, flat and fertile land washed by seven major rivers and over two hundred minor ones.

Bangladesh with a land mass of 147,570 square kilometers is inhabited by a population of 121.9 million (1996 estimate) and has one of the highest population densities of 826 persons per square kilometers in the world.

Bangladesh is ethnically homogenous except for a small tribal population of 1.2 million. The religion of dominant majority is Islam. The language spoken by the people is Bengali. It has a rich literature and culture. These provide the basic ingredients of national identity and integration supported by a long history of struggle for liberation.

The economy of Bangladesh manifests dualism. The extent of traditional agriculture is still dominant. The technology in agricultural production is changing though it is constrained by low investment by small peasant holdings. The migration out of rural areas has accelerated in recent years extending rural deprivation to urban slums. Though locational mobility has increased and occupational mobility seem to have been induced by push factors, the social mobility is still limited due to unequal access to social and economical resources.

The society of Bangladesh is dominated by a small band of indigenous middle class. Modernization has been induced by increasing outreach of radio,

television and other mass media as well as cross-culture contact. Government commitment to development of women has recently formalized in a policy statement. After long years of colonial domination and autocratic rule, Bangladesh has been ushered into a system of parliamentary democracy based on one man one vote. The democratic government is committed to devolution of decision making power to local governments. Bangladesh is poised for political stability due to dominance of two major parties whose economic and social commitments converge.

Democracy is likely to be entrenched because of competitiveness of political parties despite initial teething trouble. Administrative efficiency including that of financial institutions, fiscal discipline and tax administration is high on their agenda.

Bangladesh has liberalized its economy through reduction of tariff and regulation with the expressed intention of accelerating investment for modernization of export and its supportive social and physical infrastructure. Foreign trade has diversified and increased. Bangladesh is a low income economy and its Human Development Index is low. But recent improvement in TFR, immunization coverage, access to safe drinking water and sanitation as well rise in primary and secondary school enrolment including that of female augurs well for the future of the country. Hard core poverty has hardly changed but the micro credit institution has succeeded in ensuring an improvement of the poverty situation.

The estimated per capita GNP is US\$230 and a GDP annual growth rate was 4.3% in the 1990's. In 1980-84 hard core poverty (defined as less than 1805 KCAL consumption per day) in rural and urban areas was 38% and 35% respectively. However, in 1991-92, these figures reduced to 28% and 26% respectively. While the proportion of normally nourished children was 5.5% in 1985, it increased to 10.3% in 1996. There has been an improvement in the prevalence of severe malnutrition for under-five year children from 9.2% in 1985-86

to 4.3% in 1996. Per-capita cereal consumption has increased both in the rural and urban areas from 507.5 gms and 448.2 gms per day in 1988-89 to 516 gms and 462.3 gms respectively in 1991-92. It seem to have remained so in the 1990's.

The democratic government has taken a number of measures to stimulate growth in the economy. This has resulted in the reduction of the country's fiscal deficit from 7% of GDP in 1990-91 to 5.9% of GDP in 1993-94 and inflation from 9% in 1990-91 to around 3% in 1996-97. From a meagre scale of contribution of domestic resources to the ADP in 1990-91, the government's contributions stand at around 45% of the development budget (ADP) in 1996-97.

According to the labour Force Survey (LFS) of 1990-91, the labour force of the country stands at 56 million of which 21.3 million are women and 34.7 million men. Of the total employed 64% are in the agricultural sector, 14% in the industrial sector and 22% in other sector. The 1995-96 Child Labour Survey conducted by the BBS, shows a total of 6.5 million working children under 14 years of age the corresponding figure for 1985-86 was 2.8 million. This constitutes 11.7% of the total civilian labour force.

According to the 1991 census, 32% of the population in the age of 7 years and above are literate. The adult literacy rate (15 years and above) is 56% for men and 35% for women. The pupil-teacher ratio is high with an average of 62 primary school student to a teacher in 1995.

The average life expectancy in Bangladesh in 1995 was 58.0 years for women and 58.9 years for men respectively. According to 1996 SVRS provisional estimate, the infant mortality rate and under five mortality rate are 67 and 121 per thousand live births. The success of the EPI programme and increased use of ORT has contributed significantly towards the improved situation for child survival. However, a sustained effort and commitment is needed by the government, NGOs, private sector and the civil society to ensure that the goals related to survival, development, protection and participation of children are met by the year 2000 AD.

GOALS AND ACHIEVEMENTS

YEAR - 2000 GOAL	INDICATORS	STATUS (%)							GOAL 2000
		1990	1991	1992	1993	1994	1995	1996	
Mortality	<i>Under-five mortality rate</i>	151	146	144	139	134	128	121*	70
Reduction of infant and under-five child mortality rate by one-third or to 50 and 70 per 1000 live births respectively.	Probability of dying between birth and exactly five years of age, multiplied by 1000 .								
	<i>Infant mortality rate</i>	94	92	88	84	77	71	67*	50
	Annual number of deaths of infants under one year of age per 1000 births. More specifically this is the probability of dying between birth and exactly one year of age, multiplied by 1000								
	<i>Maternal mortality rate</i>	478	472	468	452	449	447	444*	300
	Annual number of deaths of women from pregnancy related causes, when pregnant or within 42 days of termination of pregnancy, per 100,000 live births								
Water & Sanitation	<i>Percentage of population using safe drinking water (tubewell, ringwell and tap)</i>								
Universal access to safe drinking water	Rural	88	-	-	91	96	96	97	-
	Urban	96	-	-	98	99	99	99	-
	Combined	89	-	-	94	97	97	97	80
	<i>Percentage of population using sanitary latrines (water-seal and pit latrines)</i>								
Universal access to sanitary means of excreta disposal	Rural	16	-	-	33	30	44	39	-
	Urban	40	-	-	-	77	79	87	-
	Combined	21	-	-	34	34	48	44	80
Adult Literacy	<i>Adult Literacy rate</i>								
Reduction of the adult illiteracy rate (the appropriate age group to be determined in each country) to at least half its 1990 level, with emphasis on female literacy.	Percentage of population aged 15 years and older who are able, with understanding, to both read and write a short simple statement on their everyday life	37	39	40	41	42	44	44*	62
Primary Education	<i>Percentage of children entering first grade of primary school who eventually reach grade 5</i>								
Universal access to basic education, and achievement of primary education by at least 80 percent of primary school-age children through formal schooling or non-formal education of comparable learning standard, with emphasis on reducing the current disparities between boys and girls.	Boys	43	-	45	-	-	-	-	-
	Girls	42	-	43	-	-	-	-	-
	Combined	43	-	44	-	-	60	-	70
	<i>Percentage of 6-10 years children net enroled</i>								
	Boys	60	-	-	-	83	82	79	-
	Girls	59	-	-	-	81	82	79	-
	Combined	60	-	-	69	81	82	79	95

Health (ARI) Reduction by one third in the deaths due to acute respiratory infections in children under five years.	<i>Under-five deaths from acute respiratory infections</i> Annual number of deaths of children under five years of age due to acute respiratory infections	145,000	145,000	145,000	145,000	145,000	145,000	145,000	48,000

Mortality

- a. U5MR, IMR and MMR data from Report on Sample Vital Registration in Bangladesh, BBS 1990-96.
- b. Estimates for 1996 are provisional.

Water and Sanitation

- a. 1990 figure on use of safe drinking water and sanitary latrines is a UNICEF estimate.
- b. Figures for 1993-96 from BBS-UNICEF Multiple Indicator Cluster Survey.

Adult Literacy

- a. Figures taken from Report on Sample Vital Registration in Bangladesh, BBS 1990-96.
- b. 1996 estimates are provisional.

Primary Education

- a. 1990 and 1992 data on enrollment and completion taken from Directorate of Primary Education, Primary and Mass Education Division.
- b. 1994-96 figures on net enrolment from BBS-UNICEF Multiple Indicator Cluster Survey.

Family Planning

- a. Contraceptive Prevalence Rate (CPR) for 1991 from Bangladesh Contraceptive Prevalence Survey, 1990.
- b. CPR for 1994 to 1995 Sample Vital Registration Survey, BBS. For 1996 Demographic and Health Survey, 1996-97.

Nutrition

- a. Low birth weight figure for 1990 from The State of the World's Children Report, 1995.
- b. Estimates on households consuming iodized salt for 1993-96 from BBS-UNICEF Multiple Indicator Cluster Survey.
- c. Percentage of children with goitre and low urinary iodine levels taken from National Iodine Deficiency Disorders Survey, 1993.
- d. Data on percentage of children receiving one or more doses of Vitamin A for 1990 taken from Institute of Public Health Nutrition Survey, figures for 1993-96 taken from BBS-UNICEF Multiple Indicator Cluster Survey.

Malnutrition

- a. Estimates on wasting and MUAC (1990 & 1992) taken from Child Nutrition Survey, BBS 1989/90, 1992 and 1996.
- b. MUAC figures for 1993-96 from BBS-UNICEF Multiple Indicator Cluster Survey.

Breastfeeding

Figures on Breastfeeding taken from BBS-UNICEF Multiple Indicator Cluster Survey 1996/97. Timely complimentary feeding rate from DHS 1996-97.

Maternal Health

- a. 1990 figure on percentage of births attended by trained health personnel taken from The State of the World's Children Report, 1995.
- b. Figures for 1993 to 1996 from BBS-UNICEF Multiple Indicator Cluster Survey.

Expanded Programme on Immunization (EPI)

- a. Immunization figures for 1990, 1991, and 1992 derived from Coverage Evaluation Survey Report, Directorate General of Health Services.
- b. Figures for 1993 to 1996 taken from BBS-UNICEF Multiple Indicator Cluster Survey.

Control of Diarrhoeal Diseases (CDD)

- a. Figure for Under-five deaths from diarrhoea are computed from BBS estimate of births, U5-MR and CDDP estimate of proportionate mortality.
- b. Figures for ORT (increased fluid and continued feeding), ORT Pre-1993 and ORS during diarrhoea taken from BBS-UNICEF Multiple Indicator Cluster Survey.

Acute Respiratory Infection (ARI)

Annual number of deaths due to ARI for 1990 is a UNICEF estimate.

DATA SOURCES

NOTES ON FIGURES OF MICS 1996/97

Immunization of DPT3/OPV3

Coverage of DPT3 for 12-23 months old children decreased from previous year by 11 percentage points. Possible reasons for this decrease are:

- (1) there was a DPT vaccine supply problem during May-July, 1995 and March-May 1996.
- (2) EPI sessions at the various out reach centers could not be held regularly due to unforeseen circumstances during the same period.

The Coverage Evaluation Survey of March 1997 conducted by the EPI Project, DGHS found a slightly higher coverage of 65% for DPT3. The probable reason for this difference with the MICS estimate (58% vs 65%) is that the CES cohort of children were affected less by the vaccine shortage during May-July 1995 and March-May 1996.

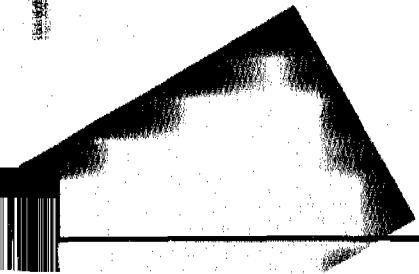

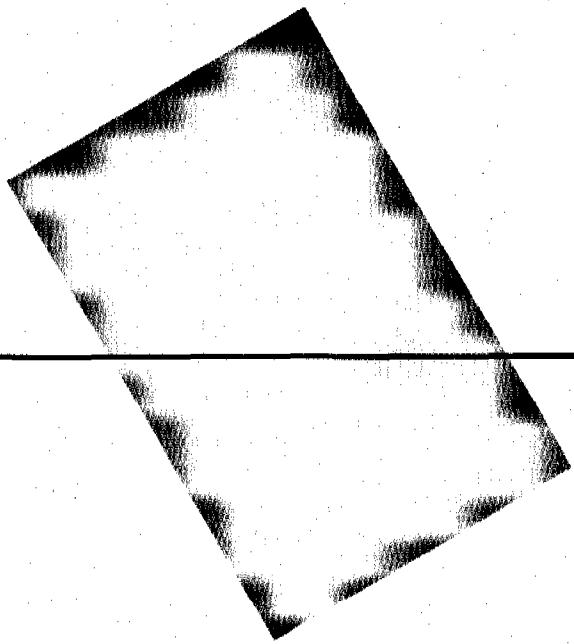

Primary school attendance rate (attendance last 3 days)

According to the MICS definition, this is the percentage of 6-10 years old children enrolled in Primary schools who have attended school for three consecutive days from the date of survey. Primary and Mass Education Division (PMED) collects data through their routine reporting system on primary school attendance with a different methodology. The difference in the two rates vary by approximately 10 percentage points. For further details concerning the methodology readers are requested to get in touch with PMED (Ph: 808125) and the BBS (tel:9114907).

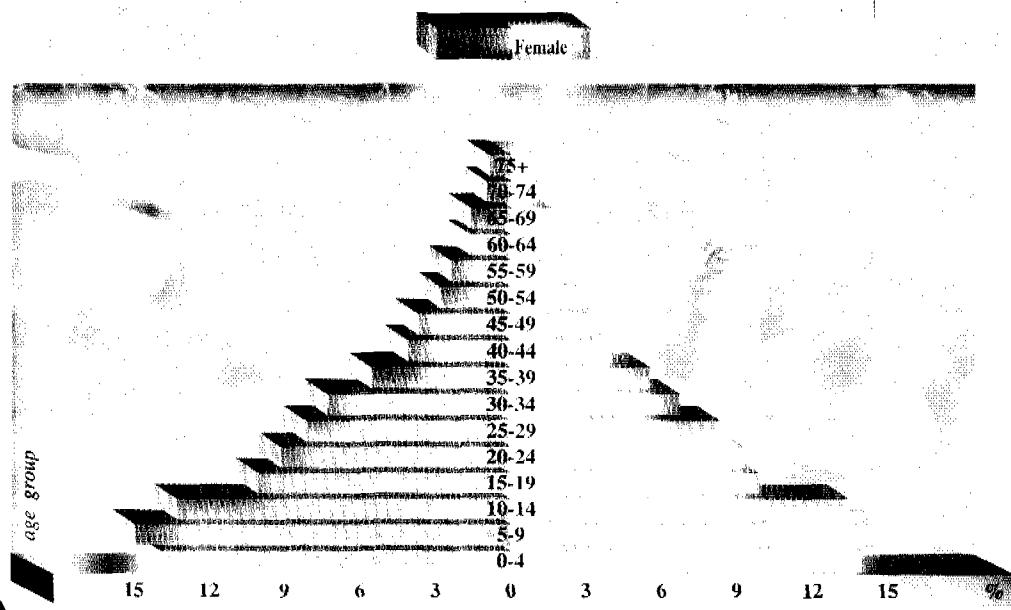

Hygienic Latrine Coverage

Coverage of hygienic latrine (water seal + pit) has decreased from previous survey by 4 percentage points. The major reasons for this decrease is due to the adverse effect of the October 1995 flood which badly affected the pit latrines. The current survey was conducted during the post flood period as such the decrease in the coverage rate from the previous survey. There is also empirical evidence that the inside walls of pit latrines which do not have a concrete ring and slab, collapse and fill up the latrine thereby making it unusable.

METHODOLOGY

Population Census Demographic Survey (PDS) and Sample Vital Registration System (SVRS) has been carrying out vital registration of births, deaths, marriages and migration in 210 Primary Sampling Units (PSU) -150 rural and 60 urban since 1980 upto 1995. In 1996 Sample size has been increased from 210 PSUs to 500 PSUs (Rural 380 and Urban 120) to get estimate at the district level. Each PSU consists of around 250 households covering a total of about 675,000 persons. Cantonments, institutions like hotels, barracks, jails, etc. were excluded from the survey. The de jure definition of population is followed here. Stratified cluster sampling of equal size has been adopted for SVRS with households as the ultimate sampling units.

Sample Vital Registration System(SVRS)of PDS & SVRS Wing,

Bangladesh Bureau of Statistics(BBS)

Definition The PSU definition is based on the 'mauza' or the 'mahalla'. A SVRS PSU is defined as a compact area of approximately 250 households. Mauza is a defined area in rural Bangladesh and is synonymous with a single village. In urban areas the equivalent is the 'mahalla'.

Urban Areas The urban universe consists of the four Statistical Metropolitan Areas (SMAs) of Dhaka, Chittagong, Khulna and Rajshahi, and seventy one other "pourashavas" (municipalities). These areas contain a population of 10.7 million or about 9.6% of the total population of the country (1991). For sampling purposes, the urban universe has been divided into the six primary strata consisting of the four SMAs, large cities and small cities. PSUs were then allocated to each of the urban strata in proportion to the number of households contained in each stratum. As a result, the 120 PSUs were distributed in 27 different cities - the 4 SMAs, 9 large cities and 14 small cities. In addition to the six primary strata, a secondary stratification was introduced within each primary stratum. In each of the four SMAs, PSUs were stratified geographically by cities, the cities were then grouped into districts and the districts into divisions. After this secondary stratification was accomplished within each primary stratum, the sample PSUs were determined by means of systematic sampling with probability proportional to the number of households.

Rural Areas Rural universe consists of areas in the country not included in the urban universe. The 380 rural PSUs were selected from 380 rural strata with an equal population size, i.e., one sample PSU per stratum. Each rural stratum consists of one whole 'thana' or a group of contiguous 'thanas' with the restriction that rural strata boundaries do not cross district boundaries.

Multiple Indicator Cluster Survey This rapid survey technique was designed with two major objectives in mind namely:- a) interplay of national and sub-national data and b) the need to provide results rapidly with comparatively simple and inexpensive survey procedures. In this survey, estimates were made for each of the 64 districts of the country in order to meet programme needs and to target appropriate interventions. On the other hand, aggregations of the district level data to provide divisional national estimates were also made for measuring progress toward the Summit Goals. To accomplish these objectives, the EPI Cluster Survey technique was modified in order to fulfill the criteria described above.

For sample size determination, measles immunization was considered as the indicator rare in occurrence, the target group being children within the age group of 12-23 months. With the precision level of +/- .10 (as in EPI design model) on the estimated prevalence rate, the sample size was calculated in terms of the number of households in order to locate the required number of sample children in the mentioned age group. The sample size of children aged 12-23 months receiving measles vaccine for a district was calculated as 126 by using standard statistical formula where the values of expected proportion of children in the age group to have received measles vaccine and design effects were taken as 0.75 and 1.75 respectively from 1993 experimental data on measles immunization.

Based on the same experimental data the sample size of 126 such children was translated to 520 households in 1994.

A review of data from 1994, 1995 and 1996 survey reveals that the number of 12-23 months children is getting scarce. The number of 520 households could not yield the required number of children in this age group to obtain an estimate with desired precision. Again, the principle of getting panel data to facilitate comparison among the surveys, it was decided to modify the sample design in terms of the number of households.

The considerations here were:

- i) to increase the sample size in terms of number of households, both by increasing the cluster size and number of clusters;
- ii) to maintain the principle of getting panel data to facilitate comparison amongst the estimates from different surveys;
- iii) to minimize the contamination effect in obtaining the panel data by repeating the same households in every survey.

Hence, the decisions taken are (a) the samples will be changed in 25% of the district/domains in each year; (b) in new sampling, 16 clusters of 50 households will be selected giving an ultimate sample size of 800 households at district level; © In the districts where the old clusters will be maintained (75% of all i.e., in 48 district and 10 urban domains), the sample size will be increased to 650 only by increasing the cluster size from 40 households to 50 households.

Cluster Design Starting from the calculated sample size of roughly 650 and 800 households per estimation area, the average cluster size was estimated to be 50 households. This meant that 13 or 16 clusters would have to be selected in each district (or urban strata) for final enumeration. Altogether 52,000 households in 1042 clusters of 64 rural and 12 urban domains throughout the country.

Clusters, for the survey, were defined as compact area segments. The segments were formed by selecting rural "mouzas" or urban "Mahallas" in the first stage of selection using the 1991 Population Census counts of households, with probability proportionate to size (pps). Each selected "mauza" or "Mahalla", was segmented in the field through the use of sketch-mapping and/or listing of households. The number of segments created in each selected "mauza" was equal to the census count of households in the "mauza" divided by 50 and rounded to the nearest integer.

After the "mauza" (or mahalla) was sub-segmented, one segment was selected at random and all the households within the chosen segment were interviewed thus covering all persons in the various target age groups. The technique used to select the sample creates a self-weighing sample in each district; i.e. every household in the district had the same probability of selection and the district-level data could be tabulated without the need to use population weights. However, while combining the district level data for divisional or national estimates proportionate weighing was done.

Stratification Two levels of stratification were selected:

- 1.Urban : Four Metropolitan Cities namely Dhaka, Khulna, Chittagong and Rajshahi with slum/non-slum population in Dhaka and Chittagong including other municipalities in six divisions;
- 2.Rural : 64 Districts excluding the Municipal Areas.

Panel Data The households surveyed during MICS 1994 were repeated in the 1995, 1996 and 1997 surveys with exception in 1997 when clusters were changed in 25% districts/domains. Repetition of the same households has minimized the sampling bias in detecting the change over time for the various indicators. This means that the influence of sampling error (confidence intervals) is minimal on the measurement of change between 1994, 1995, 1996 and 1997 figures.

Post enumeration check A Post Enumeration Check (PEC) was done by BBS in 44 (4% of total) randomly selected clusters. The findings for most of the indicators were matched with main survey. Only for a few indicators, a slight adjustment with PEC results was done.

Sampling Error Sampling errors were computed at all levels as per sample design. Medians were presented at divisional and district levels.

Implementation The MICS 1996-97 was implemented under the TAPP of the BBS. SURCH, a private research firm provided assistance to the BBS in the implementation of this survey. Field data collection was carried out by eight private agencies. Financial assistance was provided by UNICEF-Dhaka.

The data collection form was pretested and finalized in November and early December 1996. A training of trainers (TOT) was organized by BBS for all the private agencies and selected Regional Statistical Officers of BBS during the second week of December 1996. A 7 day training of enumerators was held during third week of December. Data collection period was from 20 December 1996 - 10 January 1997. Field work was carried out by 79 teams each having one supervisor and 6 enumerators.

CONFIDENCE INTERVALS OF INDICATORS

PART A (all figures in percent)

Indicators		National	Divisional	District
Diarrhoea in last 15 days	Boy Girl Both sex	1 1 2	2 2 5	6 6 5
Increased fluids & Continued feeding during diarrhoea	Boy Girl Both sex	2 2 2	5 4 10	
Treatment of diarrhoea by ORS	Boy Girl Both sex	2 3 2	5 5 13	
Source of treatment for diarrhoea	Boy Girl Both sex	2 2 2	4 5 8	
Exclusive Breastfeeding to children 6-23 months of age	Boy Girl Both sex	2 2 2	2 2 4	
Vitamin A Coverage in children < 2 years (2 doses or more)	Boy Girl Both sex	2 2 2	4 4 10	
DPT3/OPV3 coverage in children 12-23 months of age	Boy Girl Both sex	2 2 2	5 5 11	
Measles coverage in children 12-23 months of age	Boy Girl Both sex	2 2 2	5 5 11	
Prevalence of severe malnutrition (MUAC <12.5 cm) in children 12-59 months of age.	Boy Girl Both sex	1 1 1	1 1 3	3 4 3

CONFIDENCE INTERVALS OF INDICATORS

PART B (*all figures in percent*)

Indicators		National	Divisional	District
School net enrolment (6-10 years of age)	Boy	1	3	8
	Girl	1	3	9
Attendance in last 3 school working days.	Boy	1	2	9
	Girl	1	3	9

PART C (*all figures in percent*)

Indicators		National	Divisional	District
Place of last delivery (Health Centre)		1	3	2
Last delivery conducted by Trained Person		1	2	7
TT during last pregnancy		1	3	9
Ante-natal care		1	3	8
Awareness of ARI		1	3	8
Awareness about when to seek help (ARI)		1	2	5
Source of drinking water (Tubewell/Tap/Ring well)		1	2	1
Type of latrine (Water Seal + Pit)		2	4	11
Hand washing after defecation		1	2	7
Households using iodated salt		2	4	10
Type of roofing material used for the house (Tin/Brick)		2	3	11

DEFINITIONS of indicators

DEMOGRAPHY

Crude birth rate

Annual number of birth per 1000 population.

Crude death rate

Annual number of deaths per 1000 population.

Infant mortality rate

Number of deaths of children less than 12 months of age, per 1,000 live births. More specifically, this figure represents the probability of dying between birth and 12 months of age.

Total fertility rate

The number of children that would be born to a woman, if she were to live to the end of her child-bearing years and bear children at each age according to the prevailing age-specific fertility rates.

Life expectancy at birth

The number of years a new born child will live if subjected to the mortality risks prevailing for the cross-section of population at the time of their birth.

Under-five mortality rate

Number of deaths of children under-five years of age per 1,000 live births. More specifically it represents the probability of dying between birth and five years of age.

Maternal mortality ratio

Number of deaths of women due to pregnancy related causes per 100,000 live births. Bangladesh Bureau of Statistics uses 1,000 live births as the denominator.

Contraceptive prevalence rate

Percentage of married couples aged 15-49 years currently using contraceptives.

IMMUNIZATION

Tetanus toxoid during last Pregnancy

Percentage of women delivered in the last two years from the date of interview who received one or more doses of TT during this pregnancy.

Measles vaccination coverage among children 12-23 months of age

Percentage of children 12-23 months of age given one dose of measles vaccine.

DPT/OPV coverage

Percentage of children between 12-23 months of age given one, two or three doses of DPT and OPV. Here one dose of DPT and one dose of OPV were considered as one combined dose of DPT and OPV.

DIARRHOEA

Diarrhoea in last 15 days

The percentage of children in under-five age group who had three or more instances of loose or watery stools per day or blood in stool in the last 15 days from the date of interview.

Diarrhoea treatment practices

Percentage of diarrhoea cases managed by the use of ORS, Laban-gur, sugar-salt solution, any other fluid prepared at home, medicines or any other practices, at home or outside. The term ORS/Laban Gur/any other fluid prepared at home used as one of the "types of treatment" in the data does not include plain drinking water (multiple responses possible).

Source of treatment of diarrhoea

Source of treatment of the episode of diarrhoea that took place in the last 15 days. Percentage of cases received any treatment. This includes health center or qualified allopathic practitioner, unqualified village practitioners/quacks, family welfare assistant/health assistant, self/neighbours etc. (multiple responses possible).

ORT (Increased fluid + Continued feeding) use rate

Percentage of all cases of diarrhoea episode, in the last 15 days, that received increased amount of fluids and continued feeding. Increased fluids include all home made fluids, home available fluids, ORS and water. Continued feeding includes all foods (breastfeeding included) regardless of the quality of food -decreased, the same or increased. Water is considered as ORT in cases where feeding is continued (multiple responses possible).

ORS/LG/HF use rate

Percentage of diarrhoea episodes in under-five age group treated with Oral rehydration Salts (ORS) and/or recommended home fluids (multiple responses possible).

EDUCATION

Enrollment rates

Percentage of children 6-10 years of age enrolled in primary schools. The figures represent net enrollment rates. The age is assessed using an events calendar. Children following the Primary School or Madrasha text book board were considered.

Attendance in the last three days

Percentage of enrolled children who attended school in the last three consecutive school days.

Literacy

Percentage of people, 7 years or more, who can write a letter.

NUTRITION

Vitamin A Coverage

Percentage of children between 6-59 months of age who received one or more doses of vitamin A in the last one year. The Bangladesh programme administers doses of 50,000 i.u. to children less than 9 months, 100,000 i.u. between 9-12 months and 200,000 i.u. after 12 months. Two or more of such doses are considered as adequate.

Prevalence of malnutrition

Percentage of children of ages 12 to 59 months who have a mid-upper arm circumference of less than 12.5 cm. This figure represents the prevalence of severe malnutrition.

Exclusive breastfeeding less than 4 months

The percentage of 1-4 months children who were breastfeeding exclusively from their birth to the date of interview. Exclusive breastfeeding does not include honey, water or any other food except breastmilk and medicine in case of illness excluding ORS.

Duration of exclusive breastfeeding

The duration of exclusive breastfeeding in children aged 6 to 23 months. The inquiry assesses if the children were exclusively breastfed between the ages of 0 to 6 months.

Continued breastfeeding rate at two years

The percentage of 20-23 months children who were breastfeeding continuously from their birth to the date of interview with or without supplementation.

Duration of continued breastfeeding

The duration of breastfeeding (exclusive or not) in children who are currently in the age group of 12 to 59 months.

Disability

Percentage of under-five and 6-12 years children who had physical or mental disabilities. Cases where the symptoms of disability was not clear enough were termed as 'not sure' cases (multiple responses possible).

Use of iodized salt

Percentage of households using iodised salt as assessed by using starch solution.

WATER & SANITATION

Use of sanitary latrines

Percentage of households whose members use either water-seal or pit latrines. Hanging latrines, other types of latrines that do not isolate the feces, and open air defecation are considered as unsanitary latrines (Multiple responses possible).

(Note: Water seal latrines whose 'goose neck' are broken are treated as pit latrines.)

Source of drinking water

Percentage of houses collecting drinking water from the following sources - tubewell/ring well/tap other sources including marsh, pond, river, spring etc. This figure does not take into consideration the amount of water collected, the time taken for water collection or the distance of the water source from the house (Multiple sources were considered for same house)

Source of water for household work

Percentage of houses collecting water for household work (washing clothes, utensils, etc.) from the following sources -tubewell/ring well/tap other sources including marsh, pond, river, spring etc. This figure does not take into consideration the amount of water collected, the time taken for water collection or the distance of the water source from the house (Multiple sources were considered)

OTHER HEALTH INDICATORS

Ante-Natal Care

Percentage of mothers who delivered their last child within two years from the date of interview and received ante-natal care (institutional) during the pregnancy period.

ARI Awareness

Percentage of households where mothers have the knowledge that common coughs and colds can be the first signs of acute respiratory infections.

Awareness regarding when to seek help for ARI

Percentage of households where ARI aware mothers know the danger signs of acute respiratory infections (rapid breathing, chest indrawing). Multiple responses possible.

Delivery by trained personnel

Percentage of deliveries, in the last two years, assisted by a trained personnel - doctor, trained health workers, mid-wife, trained traditional birth attendant. Traditional birth attendants not using prescribed delivery kits were considered as untrained.

Place of delivery

Percentage of deliveries, in the last two years, by the place where they were took place-health center/hospital, home, neighbour's house, any other place.

ABBREVIATIONS

ANC	Ante-Natal Care
ARI	Acute Respiratory Infection
BBS	Bangladesh Bureau of Statistics
CNS	Child Nutrition Survey
CPS	Contraceptive Prevalence Survey
CSD	Child Survival and Development
EPI	Expanded Programme on Immunization
GDP	Gross Domestic Product
GNP	Gross National Product
HES	Household Expenditure Survey
